Safe And Convenient Operations

The rackless stage has been designed with a belt-driven mechanism that allows a smooth movement without any protruding part.

This design gives you a more compact solution and lowers any risk of injury after accidentally hitting the rack with your hands.

In fluorescence we can offer several options.

According to your application and to the fluorochromes you are using, we can identify the best solution.

Apart from that, generally speaking, we can identify the benefits of the HBO and LED fluorescence as following:

Traditional, HBO Fluorescence

- » The most used and diffused method, worldwide
- » Ideal for reasearch purposes

Innovative, LED Fluorescence

- » Recommended for routine applications
- » Cost-effective, money saving technology
 - » Eliminate warm-up/cool-down times
 - » Forget lamp replacement & centering

B-380 Series

BRIGHTFIELD

Transmitted brightfield illumination is one of the most commonly used observation method in optical microscopy, and is ideal for fixed, stained specimens or other types of samples having high natural absorption of visible light. B-380 Series is fitted with high-efficiency LED brightfield illuminator, for the best outcome when using this technique.

DARKFIELD

Dark Field illumination is a technique used to observe unstained samples causing them to appear brightly lit against a dark, almost purely black, background. B-383DK has a powerful LED illuminator built in the condenser and a "special" 100x Oil IRIS Objective, the ideal solution for fresh blood analysis.

FLUORESCENCE

The fluorescence microscopy is the most demanding technique in biology and the biomedical sciences, as well as in materials science. This method is capable to study organic and inorganic samples thanks to primary fluorescence (auto-fluorescence) or secondary (staining and labelling with fluorochromes). Fluorescence illuminators available as mercury lamp (B-383FL) and also as LED (B-383LD1 and B-383LD2).

MATERIAL SCIENCE / METALLOGRAPHY

Reflected light microscopy is the method for observation of specimens that remain opaque even when ground to a thickness of few microns. The range of specimens falling into this category is incredibly wide and includes most metals, ores, ceramics, many polymers, semiconductors (unprocessed silicon, wafers, and integrated circuits), coal, plastics, paint, paper, wood, leather, glass inclusions, and a wide variety of specific materials.

POLARIZATION

The polarized light microscope is designed to observe specimens that are visible primarily due to their optical anisotropic or birefringent features.

Polarized light microscopy is perhaps best known for its applications in the geological sciences, which focusses primarily on the study of minerals in rock thin sections. However, a wide variety of other materials can be examined in polarized light, including both natural and industrial minerals, concrete, ceramics, mineral fibers, polymers, starch, wood, urea. The technique can be used both qualitatively and quantitatively with success, and is an outstanding tool for the materials sciences, geology, chemistry, biology, metallurgy, and even diagnostic (gout analysis).

PHASE CONTRAST

Phase-contrast microscopy is a particular technique applied in transparent, non-stainable, samples like culture of living cells, microorganisms, lithographic patterns, latex dispersions, fibers, asbestos and subcellular particles.

It reveals many cellular structures that are not visible with a simple brightfield microscope.
